

Amendments to the Abstract:

ca A receiver for use in a vehicle includes an antenna and a controller. The receiver communicates between an actuator disposed within the vehicle for controlling the operation of a vehicle feature and a first remote device configured to attach to a surface on an interior of the vehicle. The antenna receives a first wireless signal generated by the first remote device and including a control command and a second wireless signal generated by a second remote device. The controller is configured to enter a training mode of operation wherein the controller learns a function of the second remote control device. The controller is configured to receive the control command on the first wireless signal and to communicate the control command to the actuator for execution.
